2.0 The eZdsp™ F2812 Operation

This chapter describes the eZdsp™ F2812, key components, and operation. Information on the eZdsp's various interfaces is also included. The eZdsp™ F2812 consists of four major blocks of logic:

- Analog Interface Connector
- I/O Interface Connector
- JTAG Interface
- Parallel Port JTAG Controller Interface

2.1 The eZdsp™ F2812 Board

The eZdsp™ F2812 is a 5.25 x 3.0 inch, multi-layered printed circuit board, powered by an external 5-Volt only power supply. Figure 2-1 shows the layout of both the socketed and unsocketed version of the F2812 eZdsp.

Figure 2-1, eZdsp™ F2812 PCB Outline

2.1.1 Power Connector

The eZdsp™ F2812 is powered by a 5-Volt only power supply, included with the unit. The unit requires 500mA. The power is supplied via connector P6. If expansion boards are connected to the eZdsp, a higher amperage power supply may be necessary. Section 2.3.6 provides more information on connector P6.

2.2 eZdsp™ F2812 Memory

The eZdsp includes the following on-chip memory:

- 128K x 16 Flash
- 2 blocks of 4K x 16 single access RAM (SARAM)
- 1 block of 8K x 16 SARAM
- 2 blocks of 1K x 16 SARAM

In addition 64K x 16 off-chip SRAM is provided. The processor on the eZdsp can be configured for boot-loader mode or non-boot-loader mode.

The eZdsp can load ram for debug or FLASH ROM can be loaded and run. For larger software projects it is suggested to do a initial debug with on eZdsp F2812 module which supports a total RAM environment. With careful attention to the I/O mapping in the software the application code can easily be ported to the F2812.

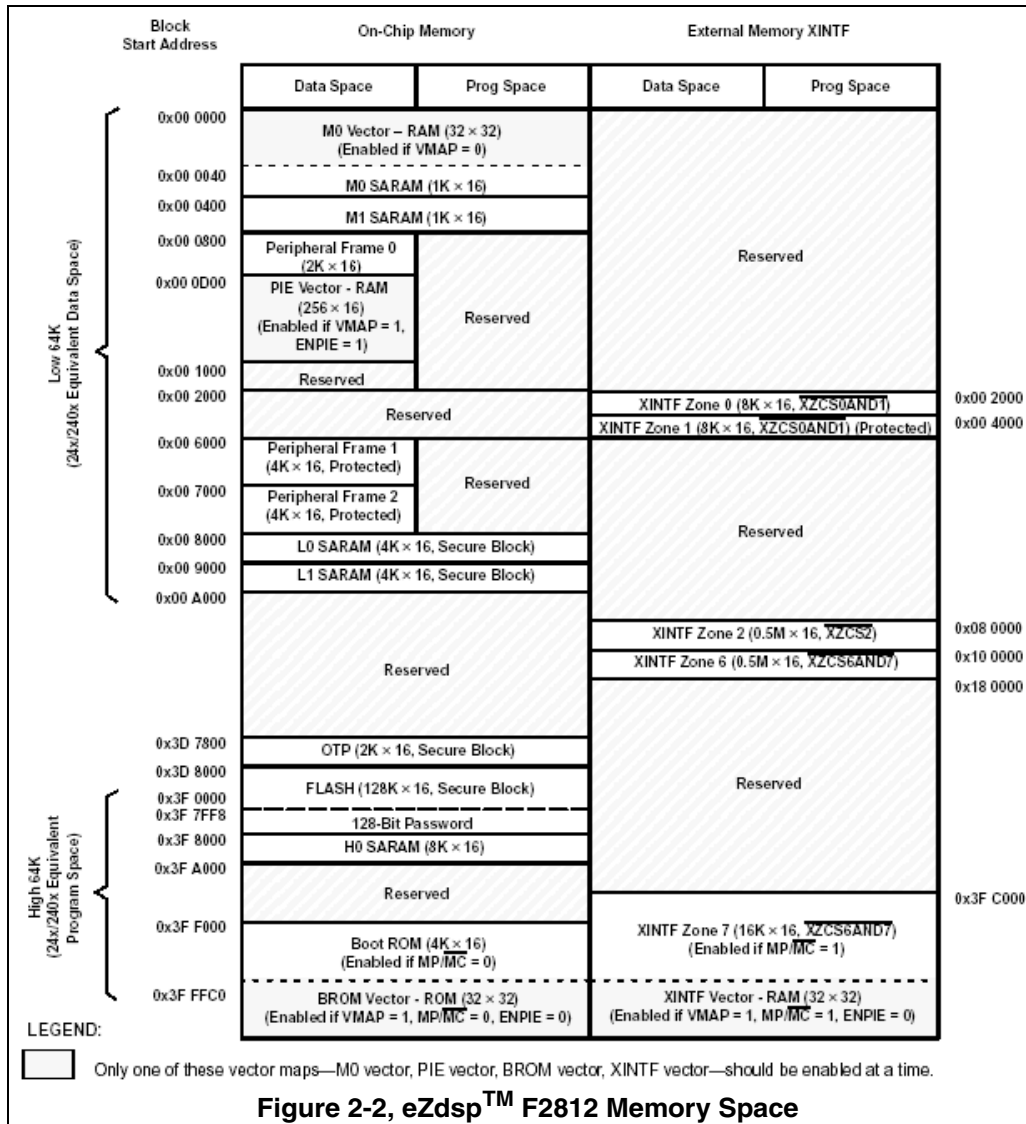

The table below shows the external chip select signal and its use.

Table 1: External Chip Select and Usage

Chip Select Signal	Use

2.2.1 Memory Map

The figure below shows the memory map configuration on the eZdsp™ F2812.

Note: The on-chip flash memory has a security key which can prevent visibility when enabled.

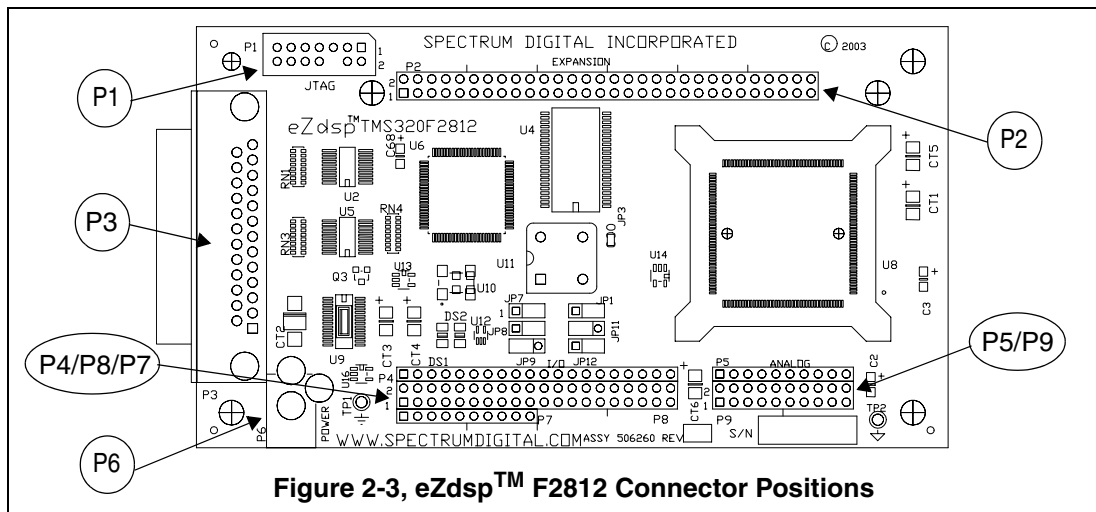

2.3 eZdsp™ F2812 Connectors

The eZdsp™ F2812 has five connectors. Pin 1 of each connector is identified by a square solder pad. The function of each connector is shown in the table below:

Table 2: eZdsp™ F2812 Connectors

Connector	Function

The diagram below shows the position of each connector

2.3.1 P1, JTAG Interface

The eZdsp™ F2812 is supplied with a 14-pin header interface, P1. This is the standard interface used by JTAG emulators to interface to Texas Instruments DSPs.

The positions of the 14 pins on the P1 connector are shown in the diagram below as viewed from the top of the eZdsp.

The definition of P1, which has the JTAG signals is shown below.

WARNING !

The TMS320F2812 supports +3.3V Input/Output levels which are NOT +5V tolerant. Connecting the eZdsp to a system with +5V Input/Output levels will damage the TMS320F2812. If the eZdsp is connected to another target then the eZdsp must be powered up first and powered down last to prevent latchup conditions.

2.3.2 P2, Expansion Interface

The positions of the 60 pins on the P2 connector are shown in the diagram below as viewed from the top of the eZdsp.

The schematics are correct for both the socketed and unsocketed version of the eZdsp™.

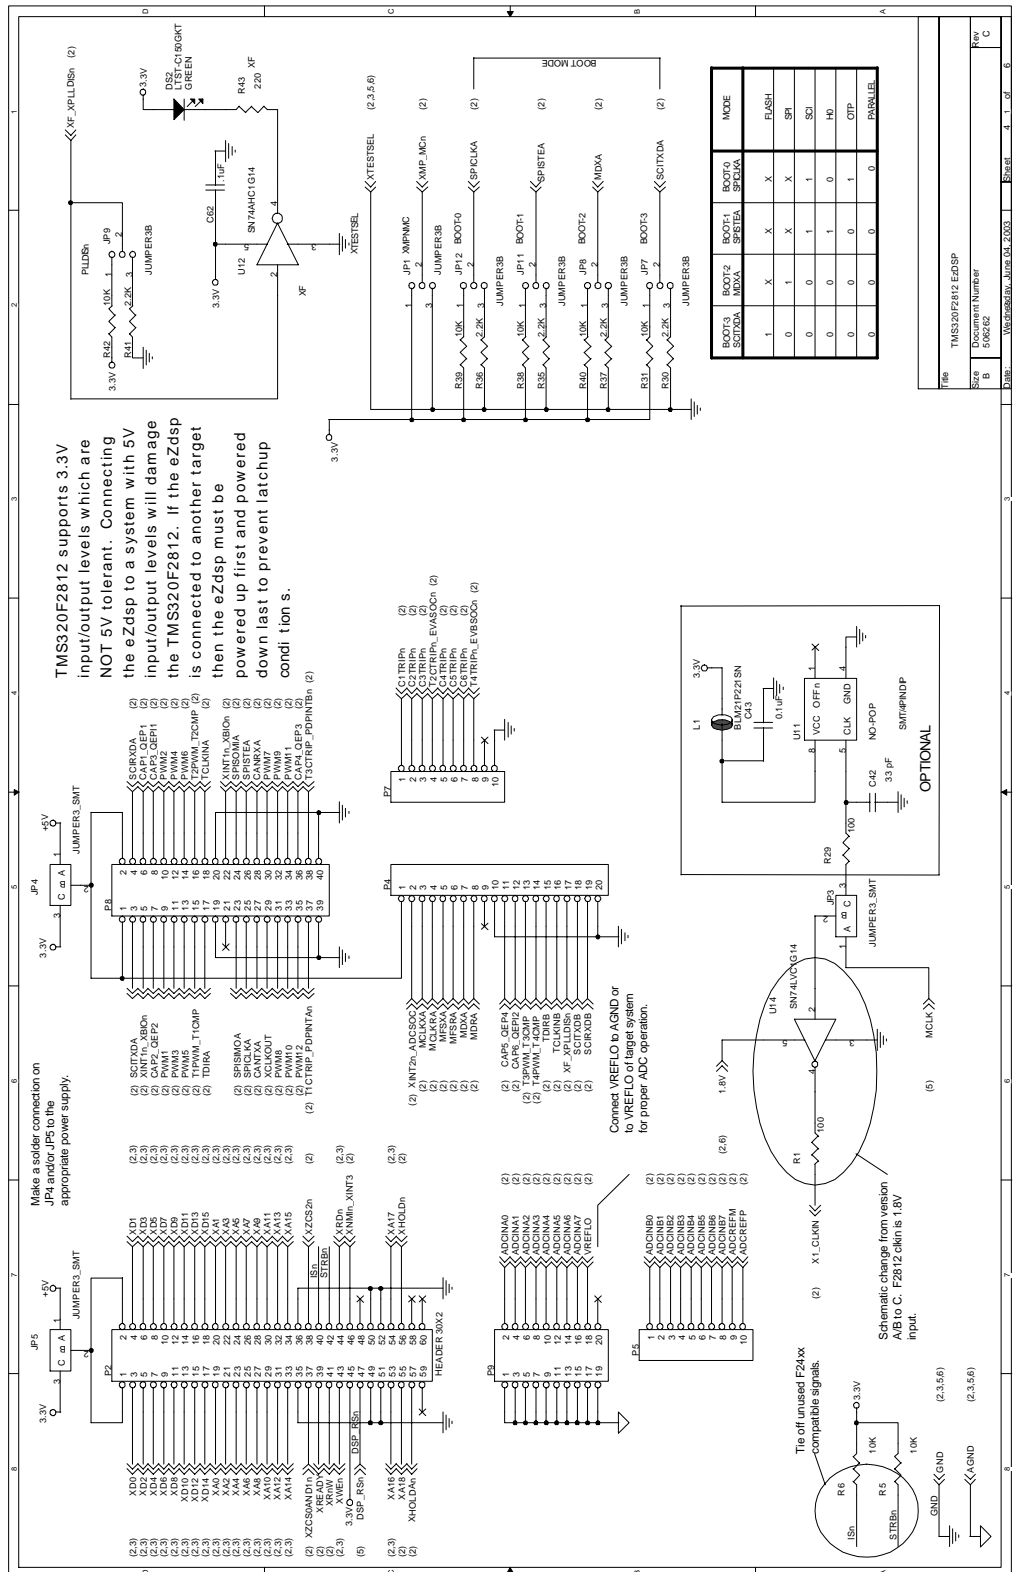

WARNING !

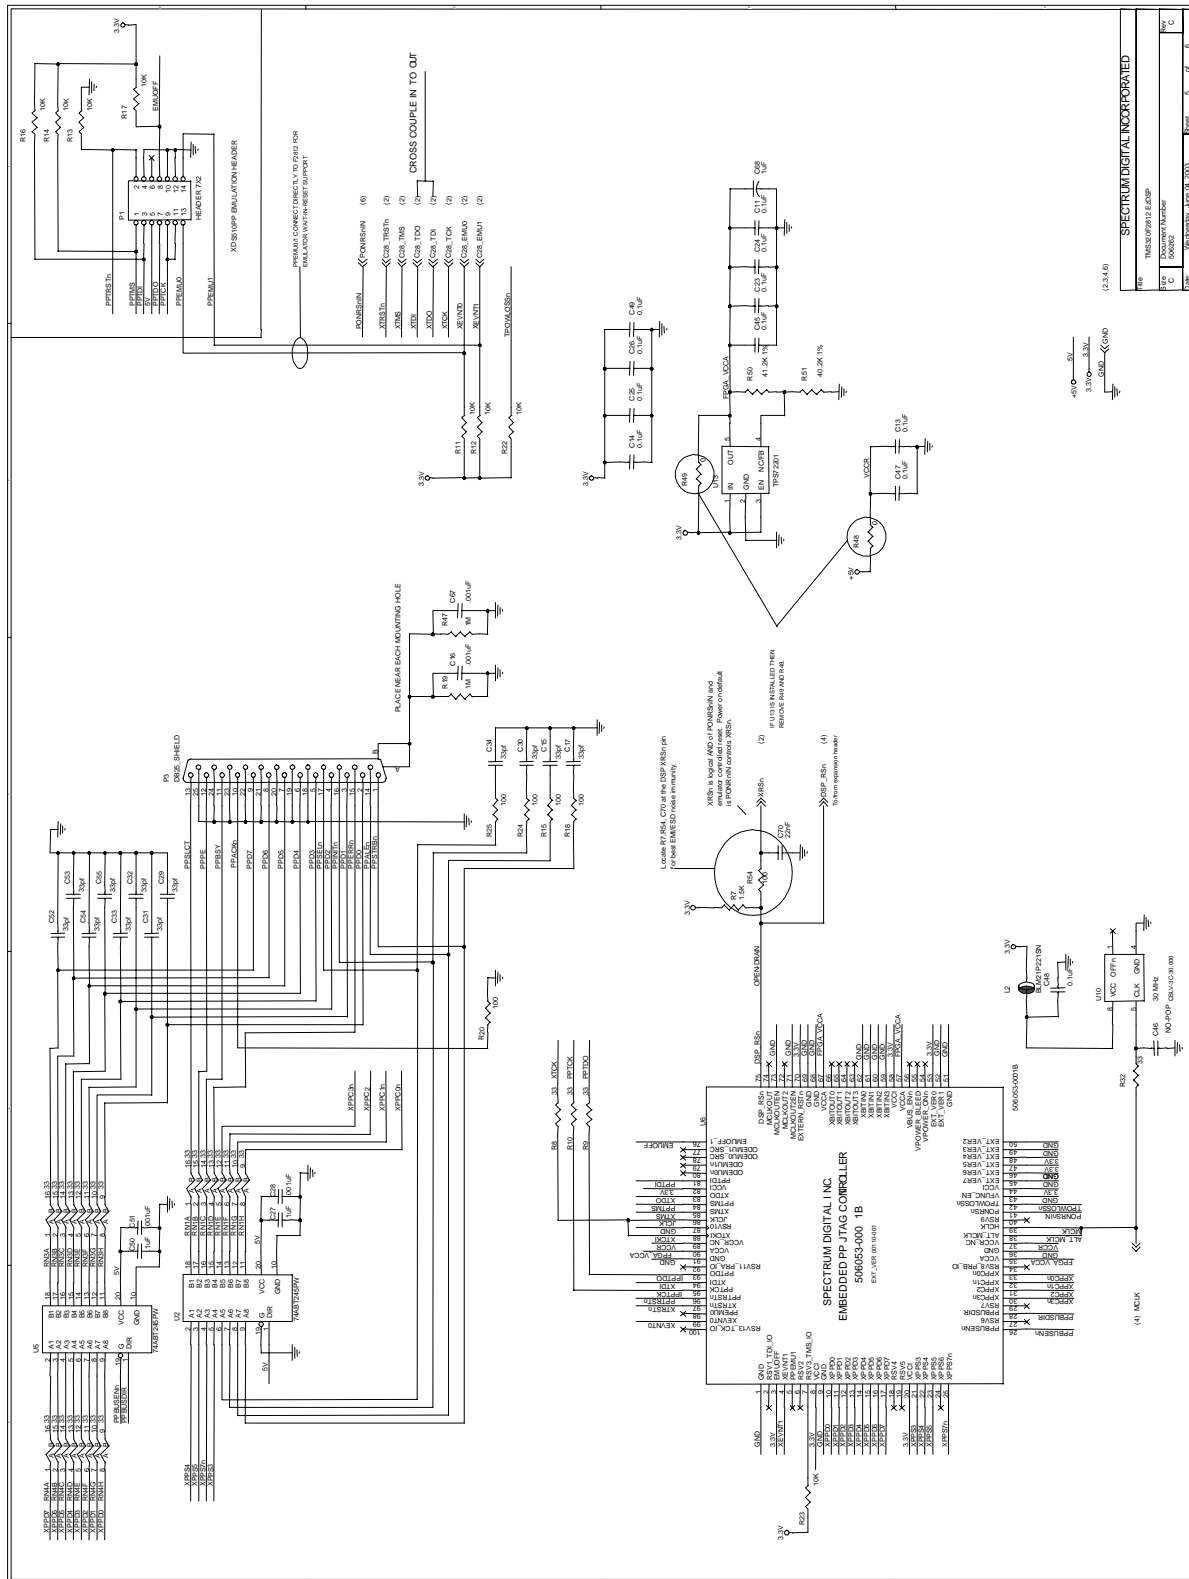

The TMS320F2812 supports +3.3V Input/Output levels which are NOT +5V tolerant. Connecting the eZdsp to a system with +5V Input/Output levels will damage the TMS320F2812. If the eZdsp is connected to another target then the eZdsp must be powered up first and powered down last to prevent latchup conditions.

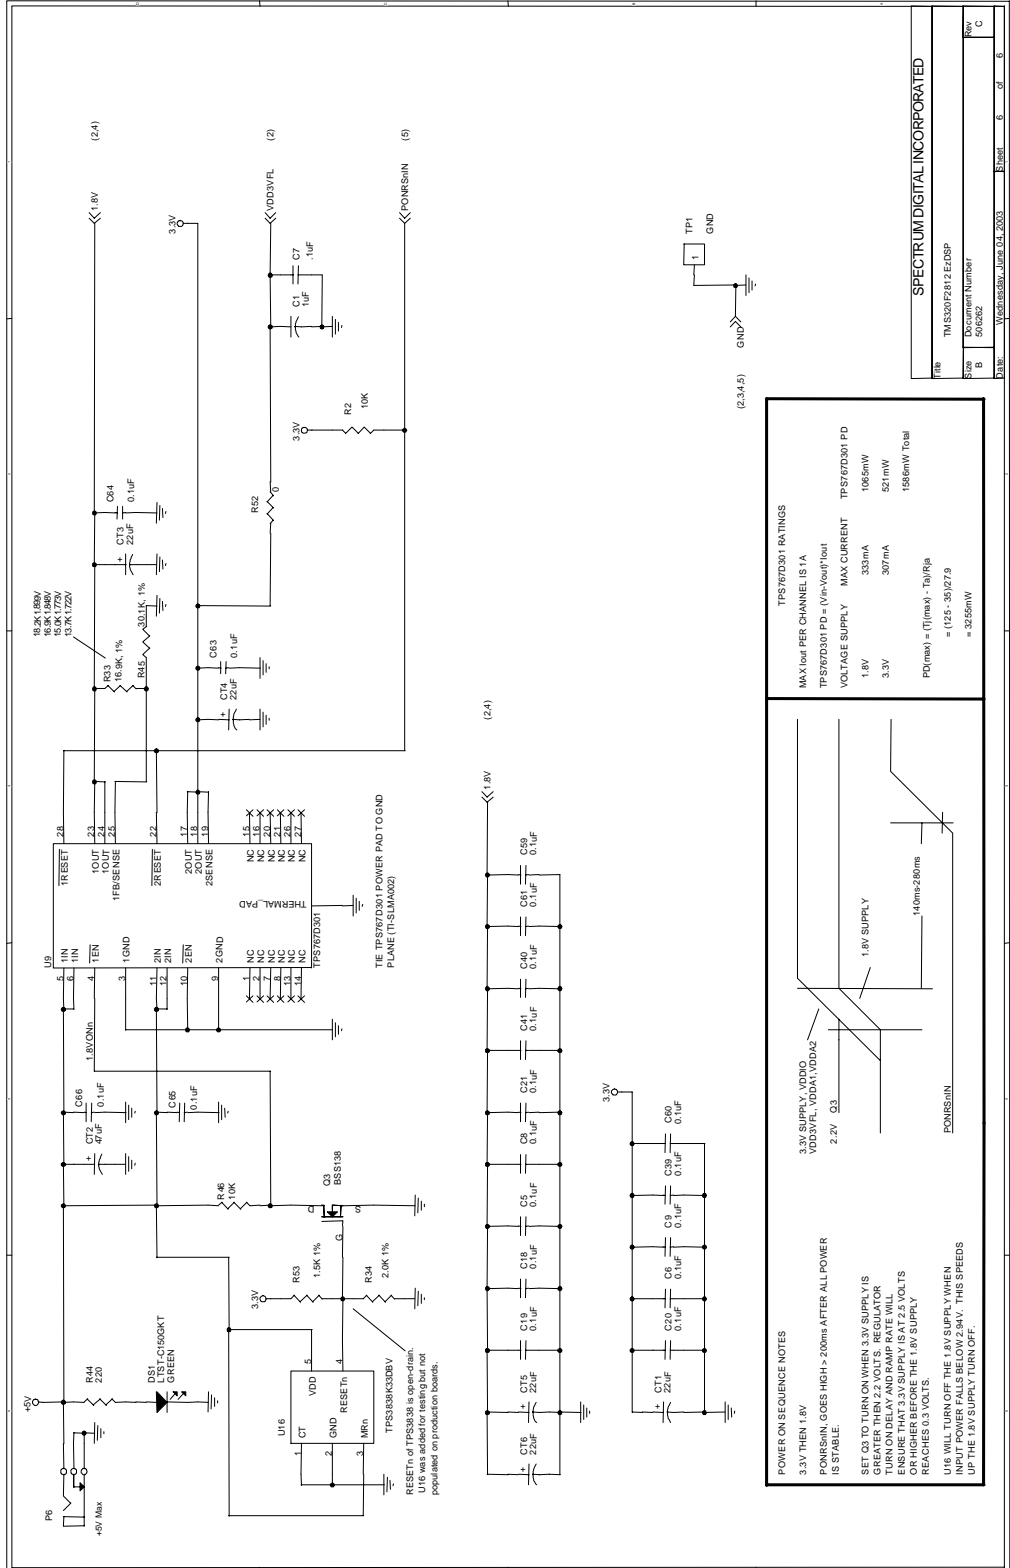

Design Notes:

1. The TMS320F2812 X1/CLKIN pin is +1.8 volt input. The clock input is buffered with a SN74LVC1G14 whose supply is +1.8 volts. This provides +3.3 volts to the +1.8 volt clock translation. Refer to sheet 4 of the schematics.
